Overload.BREVERB.2.. Overload BREVERB 2.1.8. Overload.BREVERB.2.Q: Can an intersecting family of pairwise disjoint line segments be embedded into a triangle without the line segments intersecting? As the question states, I have n line segments, each of length 1 in the plane. The segment vertices are denoted v_1 through v_n . The line segments do not intersect except at their vertices, which are the intersection points with other line segments. I would like to find a triangle in which each segment v_i is disjoint, and no two line segments cross. Is it possible to embed this into a triangle that doesn't contain line segments crossing? If so, how would I go about constructing it? A: Consider line segments $\overrightarrow{v_i v_j}$ where $i \neq j$; they need not intersect. Let $\overrightarrow{v_i v_j}$ and $\overrightarrow{v_k v_l}$ be parallel, disjoint segments. Q: Emacs mode: command to rename files I am using the emacs mode for editing my bash files. What I want is to be able to call a 3e33713323
