Developers whose work you appreciate. There are some people who create software and share it on free of charge, hoping that they will get a little recognition as a result. They are creating a big for their own projects, but they also have a positive impact on the entire community and the free software ecosystem. Oleg Romanov falls into this category. A few years ago, he created a portable antivirus application that was dubbed the "Flying Eagle" by its user community. The idea for the application came to Oleg while he was having a hard time dealing with some security problems in the system. He couldn't figure out how to solve them and decided to develop his own application so he could remove them. The Flying Eagle application has since then been converted into a portable antivirus tool. Over the years, it's become a very popular application among Windows users and has been praised by a lot of them. Despite its popularity, the developers of the application never made it a commercial product. "Antivirus" is a bit of a generic term for these applications. Many of them try to remove not only malicious software, but also a lot of legitimate programs that might be causing problems with the system. The software Oleg developed, called "Sobig.a Cleaner" (for "Sobig SID") is, as you can imagine, different from most of the other antivirus applications. It was mainly meant to remove the worm Sobig, which is about 30-40 years old. In order to remove Sobig from your computer, you need to download Oleg's application and run it in the quarantine mode. You will be asked whether you'd like to remove all detected infections or just the Sobig worm. You may also decide to temporarily disable Sobig's entries in the registry by adding the "Delete" key to each of them in the root registry hive. Sobig.a Cleaner isn't the perfect tool for this job. Sobig.a Cleaner is a lightweight and portable application designed to scan computers for the Sobig worm and remove it to restore its optimal working conditions. The tool doesn't need previous experience with anti-malware applications, since it does most of the job on its own. Find and remove the Sobig worm It's wrapped in a simple interface made from a single window that asks you to pick the scan target between all fixed drives or just a single one, if you have suspicions considering the worm's whereabouts. By picking just one drive from the list, you can significantly reduce scan time. In addition to the files from the drives, the application searches for Sobig's entries in the Windows registry. During the scanning operation, you can view the full path of the currently scanned object in the status bar. On completion, the tool lets you know whether or not it detected anything worth cleaning. In case it did, it lists the files in question and gives you the possibility to further examine them as well as to pick the ones to eliminate while keeping the rest in their current location on the disk. To make sure that objects currently used by the computer are successfully removed, it's necessary to reboot it.
