SpeedTest Crack + Free

SpeedTest is an easy to use freeware Windows application designed to test network speed and present the results in an easy to read interface. The application has been developed to be intuitive, so it's pretty difficult to get lost in the main window, even when launching it for the first time. With a straightforward approach, SpeedTest initially prompts the user to input the testing server address, which can be either a dedicated speed test server or a simple web page. The main window is also the one that displays the collected information, including server address, start time, duration, result, which is actually the transfer speed, and a simple progress bar representing the average recorded speed. The bottom of the window is more like a log panel with info concerning the speed test, showing timestamps and various details about connection and testing attempts. What's more, the program comes with a separate speed chart tab, with dedicated charts for each test, thus letting users compare the results on the go. On the bad side, SpeedTest doesn't include result exporting tools, so you can't save the results in CSV or TXT formats for example. Instead, it offers users a simple print utility via the "File" menu. SpeedTest runs on a moderate amount of hardware resources, without affecting the overall performance of your system and without requiring administrator privileges on Windows 7 workstations. All in all, SpeedTest does what it says although many more features are clearly needed. It's stable and reliable, while targeting all types of users, be they beginners or those more experienced. SpeedTest Network Speed Test Rating 4.1 out of 5 Alfeross and his team are back with the second version of Network Speed Test. SpeedTest is a unique utility designed to show the speed of a specific server, or web page in an easy-to-read interface. The main window is the only place where SpeedTest is displaying the information gathered from the server's Internet connection. The upper-right area of the main window contains a high-level summary of the server's connectivity information, allowing users to get an idea of how fast the Internet connection is, whether the server is still responding, and whether the server has issues. The bottom-left area of the main window displays some basic background information about the connection, which is displayed every time the server is chosen for a speed test. To make the application more convenient to use, SpeedTest is using controls on the main window to display the server address, the start time, and the result of the speed test.
