* Image editing is the process of changing one or more parts of an image. For example, you can increase or decrease the brightness of an image, change the color tones, add text, and so on.

Photomanipulation is the process of manipulating the shape of an image as well as changing the details of the image. You can use Photoshop to remove or replace elements of an image, or to replicate parts of the image by combining images together. * A layer is a collection of different elements. When you adjust the shape of an image, you manipulate the layer. A layer is another tool, a container, that holds the individual elements of an image. Now, let's learn the difference between Photoshop layers. # Everything You Need to Know about Layers When you create a new document, the image's layer system behaves much like the layers you create when you paint or draw. In a painting, you use a layer to show the design as you work. In a drawing, you create layers to show how you have altered the image. In Photoshop, each layer is like a separate design element. When you manipulate an image, you move a layer into position and adjust the characteristics of that layer. When you add more layers, you change the image. Like all layers, Photoshop layers can be deleted or moved, and the way that you delete layers can help teach you about the workings of layers. Also like all layers, Photoshop layers contain color information, a value, and an alpha channel. All layers in a single image have the same settings, so they can be adjusted at once, as you'll see later in this chapter. The following sections explain all these basic concepts.

Photoshop is a powerful piece of software used by graphic designers, photographers and web designers. It is not only a powerful graphics editor, it is also a professional version of the famous Paint application from the Microsoft Windows operating system. If you have never used Photoshop before, it is a must-have program for your home computer. You can use Photoshop to edit images and create new images. You can make changes such as zoom, cropping and color correction. The basic version of Photoshop is free to download and can be used on computers with a Windows 7 or Windows XP operating system. Download Photoshop for Windows You can download the latest version of Photoshop for Windows here. You can download the trial version of Photoshop and then buy a license. The trial version is fully functional and is excellent for learning Photoshop. However, be aware that this version contains 30 days

of free evaluation time. Cost Photoshop is a very expensive piece of software. The cost of Photoshop will vary, depending on the version you buy. Here are the prices for the different versions and different configurations. Basic: £79 / \$99 Essentials: £299 / \$399 Creative Suite: £569 / \$699 Package: £1699 / \$2,199 If you have a DSLR camera with a full-frame sensor, you can create photo and image editing projects through Adobe Photoshop. Full-frame digital SLR cameras are expensive. You can buy a digital camera with a smaller sensor and use the programs you download from the Internet to make editing your own images. What is the best digital camera for Photoshopping? To edit digital images and video, you will need a digital camera with a large image sensor, such as a Canon EOS Mark IV, Leica Q2, Nikon D6 or Nikon D5. This ensures that you are able to create high quality images. For those of you who want more than the basic capabilities of a digital camera, but don't want to spend the large sums of money on a full-frame camera, there are alternatives. If you don't want to pay for a full-frame DSLR camera, you can use a digital camera with a smaller sensor. For example, the Nikon D5 or Canon EOS Rebel T6 allow you to make editing projects. However, the reduced photo quality may not be suitable for some customers. Other Adobe Software Adobe Photoshop Elements a681f4349e

Q: How to pass parameters to a WCF Service I have a basic WCF Service for doing simple operations like Add, Delete and Update Operation. In my old system, I am using a Web Service and passing these 3 parameters through query string and receiving it in Service. After migrating to WCF, I can't seem to figure out how to pass these 3 parameters through WCF. I followed many youtube tutorials but no luck. Below is my code for my Service: using System.Data.Entity.ModelConfiguration.Conventions; using System.Data.SqlClient; using System.Data.Services.Client; using System.Runtime.Serialization; namespace SagePeople.Service.Services { [ServiceContract(Namespace = "")] [AspNetCompatibilityRequirements(RequirementsMode = AspNetCompatibilityRequirementsMode.Allowed)] public class TestService { [OperationContract] [WebGet] public string HelloWorld() { return "Hello World"; } [OperationContract] public void CreateContact(string firstName, string lastName, string email, string phone) { } [OperationContract] public void DeleteContact(string contactId) { } [OperationContract] public void UpdateContact(string contactId, string firstName, string lastName, string email, string phone) { } } I added NameValueCollection as parameter for my web.config:

Select and Copy • Selecting and copying This feature allows you to select an area of an image or path, and to copy it to the clipboard. There are three ways to select objects in an image: • Selecting objects from the Image menu Select the object by clicking on the thumbnail of the desired image. • Selecting objects from the Path menu Click on the path along which the object should be selected. Clicking anywhere within the path selects the object. • Selecting objects from the Magic Wand menu Click on the desired object with the lasso, and then click the Magic Wand icon. The object is selected. When you copy an object, the same coordinates from the active layer are retained in the copied object. For example, if you select a pen tool or paintbrush tool, your selection will include the whole pen or brush. If you copy the selection, the copied object will include the same areas that you had selected. If you have cut the selection, the area you selected will be included. The Cut function creates a freeform mask. When the Cut function is applied, the area to be cut is enclosed in a freeform selection. If the selected area is outside the canvas, the Cut

operation will extend the selection to the edge of the canvas. The Cut function automatically places the original file in the background.

- Selecting objects from the Selection menu Select the object using the select menu. Choose from the selection menu to select multiple objects, the marquee select tool, and more. A common feature of the Select menu is the ability to select a group of objects that are linked, or to select a range of values using a slider.
- Selecting objects from the Lasso menu The Lasso tool allows you to perform selections that have the same shape and position as the selected tool. The last point where you clicked is the starting point of the selection. The lasso tool can be moved and rotated with the arrows on the tool. To select the mouse, hold down the Alt key. The shape and size of the lasso tool can be changed using the lasso tool options on the Option bar. The modifier keys control these features, including:
 - The size of the selection. The size is the distance between the last and first points of the lasso selection.
 - The brush control setting determines the size of the brush on the selection. To enter this setting, click the brush icon. There are three options:
 - Original—The brush becomes the default size
