Using these measurements, medical personnel, nutritionists, doctors, nurses, therapists, caregivers and others can make informed decisions and changes in diet, nutrition, prescriptions, therapies, therapies and other actions related to the health and well-being of the subject. It is often necessary to make such changes during a subject's sleep cycle, when the subject cannot voluntarily report his or her physiological condition. Thus, there is a need for reliable, non-invasive methods to determine the physiological condition of a subject during sleep. Further, accurate methods of measuring a subject's physiological condition during sleep are important during surgery where it is necessary to administer drugs to the subject before, during, or after the surgery. Determination of the subject's physiological condition during sleep is also important in hospital settings to monitor the health of patients or in the home environment to monitor the health of an elderly person or sleep apnea patient, among others. It is therefore an object of the present invention to provide a system and method for non-invasively measuring various physiological properties of a subject during sleep in a hospital or home environment.Snapchat is set to announce its first round of new features at its F8 conference on Tuesday.
