mesenchymal stem cells. p63alpha plays an important role in ectodermal development, such as in hair follicle and skin appendage morphogenesis. Although p63alpha also plays an important role in mesoderm development, its role in bone development remains unclear. To understand the role of p63alpha in bone development, we investigated the effects of p63alpha in osteogenesis using p63alpha overexpression and siRNA-mediated knockdown in bone marrow mesenchymal stem cells (MSCs). At the early stage of osteoblast differentiation, the differentiation process of MSCs was significantly enhanced in p63alpha overexpression groups. At the later stage, the expression of osteoblast marker genes, such as alkaline phosphatase (ALP) and bone matrix protein, were increased.
