History Autodesk started in 1982 as a development software company. Initially Autodesk products were mainly focused on architectural and mechanical drafting. In 1989, Autodesk released AutoCAD, a 2D drafting program, which quickly gained popularity as a CAD application among architects, civil engineers, and mechanical and electrical drafters. After introducing 3D features in the 1990s, Autodesk added support for parametric design in the late 1990s, which was followed by creating a whole design application in the form of AutoCAD Architecture, for non-architectural design in the late 1990s. AutoCAD for 3D Civil Design was introduced in 2002. Subsequent Autodesk products were (and are) more oriented to construction drafting and other construction-related tasks, such as 3D civil design. In the 2010s, Autodesk also included support for product design, construction management, engineering analysis, testing and inspection. Software (2003–present) As of January 2017, Autodesk has 31 products with the 'Autodesk' name and includes about 30 million customers. The company has about 30,000 employees. Select one of the following options and make a backup copy of your current license. (so we can remove it if it's not working for you) Switch to the "Licenses" tab, and make sure that the "Out-of-Date Licenses" checkbox is UNCHECKED. To update to a newer version Go to your "My Licenses" tab, and click on "View All Licenses" Find the latest license version, right-click and "Import". And that's it. Now, you'll need to re-activate it, and tell Autodesk if you want to update. Smooth muscle growth associated with injury: an autoradiographic and immunohistochemical study of feline models of ulceration and strangulation. The sequential appearance of tissue protein synthetic activity and epithelial cell turnover was studied using autoradiography and cell proliferation antigen Ki-67 in samples of feline intestinal smooth muscle from models of acute gastric ulceration and strangulation. The pattern of protein synthesis and cell proliferation was examined in the smooth muscle within 1 and 5 days after ulceration and within 2 and 3 days after strangulation. Autoradiographs showed that smooth muscle tissue adjacent to sites of ulceration displayed enhanced and extended incorporation of [3H]thymidine and [3H]leucine compared to that from sites of gastric ulceration without tissue damage. The sites of smooth muscle injury were also confirmed by immunohistochemistry using a monoclonal antibody to Ki-67 and samples were processed using a streptavidin-biotin immunohistochemical method. Histological examination of samples showed that the epithelium was mildly to moderately hyperplastic but there was no evidence of regeneration. In contrast, in samples of smooth muscle from the lesion site, increased numbers of Ki-67 positive nuclei were seen in the majority of the cells immediately adjacent to the ulcerated surface epithelium. The autoradiographic findings show that stimulated smooth muscle growth at the sites of tissue injury is evident within 1 day of injury and that these responses extend over a time period of at least 5 days. This tissue growth at the site of mucosal injury may have relevance to the pathophysiology of mucosal ulceration in man.Epidemic spreading in non-homogeneous networks. We study the effect of non-homogeneous degree distributions on the epidemic spreading in networks. The system
