To save files to a computer, you must connect your camera to it, which is not always an easy or natural thing to do. But in Chapter 3 you'll learn how to use your camera's built-in computer to update and upload images to a computer, transfer them to a portable device, e-mail them, or wirelessly send them to mobile devices. Photoshop is one of the two most popular programs used with digital cameras. The other is Adobe Lightroom (which I talk about in the next section). Understanding Photoshop's various editing tools You use Photoshop to edit and manipulate raster images and color images (in many instances). When you create raster images, you use Photoshop for the original photography. The original image, or RAW image (which stands for raster image), is the raw version of the image file that the camera captured. The RAW file stores color data along with the negative and exposure information used by the camera to capture the image. The RAW file that the camera captured may have been compressed by the manufacturer and stored in a format you can't edit. RAW files must be converted to a different format before you can edit them in Photoshop. Sometimes RAW files are already compressed. The RAW file doesn't contain all the data you need to view, correct, and edit that image. RAW data is not as compressed as JPEG or TIFF images and takes up more of the hard drive space on your computer. From an artistic standpoint, a RAW file is the only type of image file from which you can create professional results. It's like a blank canvas and offers you freedom from the limitations of JPEG images. With RAW files, you get better-looking, more-accurate colors and shades. You can create unique contrast, brightness, and color effects through exposure settings, histogram settings, and other editing tools that are not available in JPEG files. However, RAW files are complex and more difficult to work with than JPEG or TIFF files. You must use a specialized RAW editing program to convert the RAW file from the camera into a file that you can edit in Photoshop. The camera manufacturers often provide software for use with their own cameras. Most current cameras have the capability to convert the RAW file into a more simplified image format such as TIFF, which requires less processing. Many people just prefer JPEG files, which offer faster and better image quality because they offer smaller file sizes. JPEG images also make editing and manipulation easier in Photoshop. To

If you are not a huge fan of the professional version of Photoshop, you may want to consider saving your money and picking up Photoshop Elements instead. In this tutorial, we will show you how to use Photoshop Elements to edit an image in a fun and easy way. Step 1: Import a Photo There are two ways you can import a photo. The first way is by using the built-in photo browser. Use the + icon to add a photo from your hard drive. The second way is by using the Import From Files option and choosing a file from the computer. We will be using the latter for this tutorial. Step 2: Adjust Color Tone and Sharpen a Photo Open the file in Photoshop Elements and then use the Image > Adjust > Enhance > Image. In the Enhance menu, you will see the Highlight Color and Exposure sliders. Use the Highlight Color and Exposure sliders to desaturate the image or brighten up the image, while adjusting the contrast. Step 3: Add a Brightness and Contrast Filter Next, you may want to add a Brightness and Contrast filter. Use the Brightness and Contrast sliders. Step 4: Use the Image > Adjust > Sharpen to Sharpen the Photo To apply a Sharpen filter, use the Sharpen icon in the Adjust menu. Step 5: Add a Noise Filter Sometimes, images appear a little pixelated. This may be caused by the image sensor or the lens being used to take the photo. To apply a Noise filter, use the Noise icon in the Adjust menu. Step 6: Fix Lens Distortion Sometimes, photos appear very blurry and distorted. This may be caused by the lens itself or your computer. To remove Lens Distortion, use the Lens Distortion icon in the Adjust menu. Step 7: Adjust Posterization and Sharpen a Photo Open the file in Photoshop Elements and then use the Image > Adjust > Posterize. To apply a Posterization filter, use the Posterize icon in the Adjust menu. There are four different Posterization types. Use the type from the top drop-down menu. To apply a Posterization filter with the Grain and Edges selected, choose the options from the second drop-down menu. Increase the Posterization count for a more grunge-like 05a79cecff

Love this club Spain's FIFA team pick up 5 awards Spain's FIFA team has been named as the World XI to be presented next month at the FIFA Ballon d'Or Gala on Dec. 7. Tito Vilanova scored the winning goal in the World Cup final, but he won't be able to take the celebrated trophy home to Spain. The World XI has four players from the current Spain squad, including Xavi, Andres Iniesta, Jordi Alba and David Villa, who won the Golden Ball and Young Player awards at this year's FIFA Ballon d'Or. The current World XI includes Argentina's Lionel Messi, Germany's Philipp Lahm, Brazil's Kaka, Xavi and Iniesta, and Spain goalkeeper Iker Casillas.Q: How can I setup a NodeJS chat system? I have decided to make a new project for myself and just finished my first full scale Javascript web app, and I wanted to use NodeJS rather than PHP and I'm enjoying it so far. I would also like to get this chat system from the webchat-rails gem. Here is what I was thinking of doing. I would like some simple non-parsed JSON messages to be pushed to users by a background process(db, server, cron, etc). Then, within the user's program, the following would happen: User enters in their username and when they do, instead of waiting for them to type in the message, the program receives that message, and then sends it back to the server and pushes that message to the database. If the user clicks on a button that sends the message to all or a list of users, then the server would push that JSON message to all the clients. And clients should receive the message, and display it. This project must work on mobile devices and desktops (chrome, firefox, safari, etc). Does this seem possible? Or is there a better way to do this? Thank you! A: Yes you are on the right track. Below is a part of code that implement a backend to a simple chat. I think it is what you are looking for. var stream = require('stream'); var sock = require('net').createServer(); sock.listen(8124, function () { console

The Eraser tool, symbolised by an "E" on a toolbar, allows you to remove or delete pixels from images. It's often used to remove pixels, which can be of any colour, from an image. You can also use it to remove the colours of an image, leaving only the black and white. You can erase images in different ways, depending on what effect you are after. The Gradient tool allows you to change the colours in an image, and create transparent spots or lines. It also includes the Mixer, where you can add colours together to create a new colour. There are four gradient types: Linear, Radial, Pattern and 3D. The Pixelate tool, which is a type of eraser, can make images look grainy or distorted. The Pen tool, which is symbolised by the stylus pen, creates lines, circles and polygons. The Pen has two tools: a Freehand tool and a Brush tool. You can use the Freehand tool to draw a path on an image. The Marquee tool is used for selecting areas of an image, and the Lasso tool, which is symbolised by a "L", allows you to draw or select a rectangular box on an image. The Heal tool fixes distorted areas of an image. You can use the Spot Healing tool, which is symbolised by a "+", to find and replace a small area of pixels with similar colours. The Spot Healing tool can also be used to add colours that were lost. The Move tool allows you to move images around on the screen. It can also be used to resize the image to a larger or smaller size. You can go from a zoomed view of an image to a full size view in one step. The Zoom tool, which is a shortcut for the Move tool, allows you to zoom into a picture. The Crop tool, which is symbolised by a "C", enables you to zoom in and out of an image and remove areas of the image. The Crop tool also allows you to crop the image in different ways. You can crop it horizontally, vertically, or both horizontally and vertically. You can also crop it to a square or rectangle. You can use the Horizontal and Vertical Guides tool to find the edges of an image, and help you to crop to a specific size. The Pencil tool allows you to draw on your images using a smart pen. You can draw with different types of lines, and
