* ****Color Picker****. Photoshop's most useful feature is the Color Picker, where you can choose or edit colors. You can get the Color Picker palette tool from the Tools panel, or you can access the Color Picker from the Edit menu, where the fourth option is Pick Color. Another helpful way to access the Color Picker is to click and drag over an image. A new Color Picker dialog box will appear where you can

choose from a variety of color modes.

When you pick a color, Photoshop automatically adds a color swatch on top of the image, and its color label appears in the Layers palette. Here are a few points to remember about the Color

Picker: * You can keep in mind that your monitor's color profile controls the colors you see in the Color Picker. If you pick colors that are accurate to your monitor's profile, the Color Picker won't let you choose those colors. If the image you are viewing on your monitor isn't what the software assumes to be the monitor's color profile, then the colors may look different. To fix this problem, click the button in the lower-

right corner of the Color Picker dialog box and choose the `_Correct_` button to correct the profile. * To access the Color Picker palette, choose Edit → Colorize → Colorize Image or press Alt+Y. * To access the Color Mixer, choose Edit → Colorize → Color Mixer or press Alt+S. * To access Hue/Saturation, choose Edit → Colorize → Hue/Saturation or press Alt+O. * To access Blur, choose Edit → Colorize → Blur or press Alt+E. * To access other color modes, choose Edit → Colorize → Edit Modes.

Q: problem with bash re-set environment variable I have two bash scripts that share an environment variable. caller.sh: `#!/bin/bash source ~/.bashrc echo "env = $env"` caller.sh: `#!/bin/bash echo "env = $env"` When I run the two scripts in succession like this: `$/caller.sh env = ENV1`
`$/caller.sh env = ENV2` Why is it that calling `source ~/.bashrc` in a script doesn't reset the variables? A: Check your `~/.bashrc`. If it contains the lines: `if [-s "$HOME/.bash_profile"] ; then . "$HOME/.bash_profile" fi if [-s "$HOME/.bash_login"] ; then .`

"\$HOME/.bash_login" fi Your \$ENV1 is being reset. Try deleting those lines. This invention relates generally to a lubrication system for an air compressor, and more particularly to a lubrication system having multiple recharging ports. Air compressors are commonly used to supply compressed air to various types of equipment such as, but not limited to, automatic and pneumatic equipment, hand tools, power tools, and high speed pneumatic tools. A typical air compressor includes a fluid pump which draws air from the atmosphere and discharges compressed air to a storage tank or container. With the demand for compressed air, there

are times when the storage tank is overfilled resulting in the creation of pressure in the air line. During these pressure build up periods, if the operator does not cut off the air line, the compressed air will discharge to atmosphere creating high noise levels. A pressure relief valve is typically located in the compressed air system that discharges compressed air to atmosphere when the pressure exceeds a predetermined level. Pressure relief valves typically employ a spring with a manually actuated lever to open the valve and relieve the excessive pressure. The spring forces the valve open when the internal pressure of the air

compressor is above a predetermined level. In the past, air compressors have been equipped with only one pressure relief valve, which was located on the bottom of the compressor tank.

Typically, the outlet port of the air compressor was located on the bottom of the tank and this port was used as the single

???????? Vaginal birth after cesarean: still controversial? The rates of vaginal birth after cesarean have not been constant during the past 30 years. The

trend has been increasing despite the overall reduction in the rates of cesarean section. It has been also reported that women who had a trial of labor after previous cesarean were more likely to have a successful vaginal birth after cesarean than those who did not. Most of studies are retrospective, having a major limitation in their ability to detect possible risk factors for cesarean section. Therefore, the importance of performing a prospective study with adequate statistical power is emphasized.
